

Threaded-Body Cylinder
single acting with spring return
max. operating pressure 500 bar

Version without female thread

Version with female thread

Version with swivel contact bolt

Description

These threaded-body cylinders can be threaded directly into tapped holes in the fixture down to the hex-section of the cylinder body. Spacings between cylinders can be minimised when cylinders are arranged in a row, since the oil is fed through drilled passages in the fixture. Sealing is made with the supplied sealing ring at the bottom of the location hole.

A long piston guide in combination with an O-ring/back-ring seal provides trouble-free operation.

Material

Piston material: casehardening steel, hardened
Cylinder body: free-cutting steel

Important notes

Threaded-body cylinders must not be subjected to a load in retracted position.

Cylinders have to be protected against direct influences of aggressive cutting lubricants and coolants.

A version with very little leakage equipped with a double-wiper, that has the same technical data, can be found on data sheet B 1.461.

Operating conditions, tolerances and other data see data sheet A 0.100.

Porting details

Accessories

Mounting bodies

The installation of threaded-body cylinders directly into fixture base plates and walls becomes possible by means of mounting bodies, which are provided with porting for threaded fitting connections.

Application examples

The opposite figure shows a multiple clamping fixture for clamping of small parts. The cylinders can be arranged in a clamping bar or yoke.

Workholding with the use of reversing levers is particularly suited for workpieces which have to be clamped high above the fixture base plate. The force-loop closed within a limited fixture component space eliminates bending forces from entering the fixture base plate. The reversing lever allows easy adaptation of the lever ratio to the clamping force required.

This example shows a detail of a clamping fixture for exhaust manifolds, where under limited space conditions the use of reversing levers allows clamping of workpieces with intricate contours.

The above multiple clamping fixture is equipped with threaded-body cylinders with swivel contact bolts. The 3° incline of the threaded-body cylinders effects a low-clamping force of approx. 5% of the clamping force. On plane clamping surfaces swivel contact bolts obtain little surface pressure on the effective points.
